

MA1 port

The vehicle drives the identification point over the ground loop, the identification cameras take a picture of the license plate and the access control software identifies the comer.

The light changes to green. The boom rises and after that you can drive in from the gate.

The boom safety eyelet allows the boom to descend when the vehicle has been gone from under the boom.

The gate is ready to receive a new entrant to the Stop line as soon as the light turns red again and the boom begins to descend.

The gate will operate without interruption of the comer waits until the previous car has passed through the gate before entering the Stop line.

The shortest turnaround time is about 10 seconds.

Wait before driving to the Stop sign, the previous vehicle is inside the port are and the light has turned red.
